

94% of customers bought only once

RFM analysis of 1,000 transactions (Apr 16 – Jun 10, 2023). The conclusion: segmentation is not meaningful on this data, and that is a valid result.

1,000	946	895	513.7K
transactions	unique customers	bought once	total transaction value

Almost nobody comes back

Of 946 customers, only 51 bought more than once, and only 3 bought three times. Frequency is almost constant, so it cannot tell customers apart.

Customers by purchase frequency

Segments differ in R and M, not in F

Customers are split by quartile scores on Recency and Monetary. Average frequency in every segment sits between 1.01 and 1.13, so behavior barely differs even though spend differs about threefold.

Segment	Customers	Recency (days)	Monetary (avg)
Recent, high value	241	15.5	830
Recent, low value	232	14.3	277
Lapsed, high value	232	44.7	790
Lapsed, low value	241	45.4	275

Segments were recalculated for this report using a simple split (Recent/Lapsed × High/Low value), so sizes may differ from the 378/235/189/144 in the earlier session.

Weekly sales

Sales peak from late April to early May. The last week is lower because it only covers June 10.

Transaction value per week (thousands). *Last week is incomplete; label = week-ending date.

Locations and products are fairly even

No location or product stands out. Tokyo and Product C lead by a small margin.

Transaction value by location

Transaction value by product

Takeaway

A 60-day window is too short to tell whether customers return. RFM needs repeat behavior; a dataset like Olist is a better fit.
